## **1.0 Introduction**

This permit applicant guide outlines the requirements for requesting a permit to purchase and use a pesticide (i.e., larvicide to control mosquito larvae) for the prevention or control of West Nile Virus (WNV) on public property under the jurisdiction of a municipality or Board of Health (including Ontario's 37 Public Health Units) when supported by the local Medical Officer of Health (MOH). Public notification requirements for WNV larvicide programs are included in this guide (see **Appendix 2**).

**NOTE: This guide does not include mosquito larvicide programs intended for nuisance control.**

Regulation 914 under the *Pesticides Act* requires:

- a person to obtain a permit approved by the Director under the Act, authorizing that person to apply a pesticide to a water body to control a pest (referred to as a water extermination).
- a licensed exterminator holding a Mosquito/Biting Flies or Aerial licence to obtain a permit approved by the Director under the Act, authorizing that exterminator to apply a pesticide to a water body.

Completed permit application forms and support documentation must be submitted to the Regional Pesticides Specialist (**See Table 1 for office locations**) responsible for the county in which the pesticide application will take place.

## **2.0 Mosquitoes as Vectors of West Nile Virus (WNV)**

The risk assessment made to determine whether WNV may or will impact people is based on numerous factors. The identification of mosquito larvae and adults species present and their numbers is a part of this risk assessment and will determine the location and timing of larvicide applications, in order to disrupt the transmission cycle of WNV.

*Culex pipiens* and *Cx. restuans* are two mosquito species that feed predominately on birds but will occasionally bite humans and other mammals. *Culex* mosquitoes overwinter as adult females and possibly overwinter infected with WNV. It is also possible that migratory birds also return to Ontario infected with the virus. In early spring, the pre-mated *Culex* females that have survived the winter disperse from overwintering sites in sewers, outbuildings, subterranean enclosures and basements to feed on the blood of birds (especially nestlings). *Culex* mosquitoes feed mainly after

sunset and before dawn.

In Ontario, *Culex pipiens* and *Cx. restuans* are thought to be the species of importance in maintaining and amplifying WNV in the bird population. After feeding on the blood of birds, female *Culex* lay their eggs in containers, catch basins, grassy roadside ditches, tire ruts, rain barrels, swimming pool covers, stored boats or other containers that hold stagnant water. A favourable breeding site in early spring for *Culex* mosquitoes is inside cups, pop tins, plastic bottles, plastic bags, abandoned tires and other litter. *Culex restuans* females emerge earlier than *C. pipiens* and the discarded containers that hold snow melt waters and spring rains provide an attractive incubated breeding site. Discarded litter should be collected and properly disposed of in early spring to reduce the number of potential breeding sites.

Several overlapping generations of *Cx. pipiens* or *Cx. restuans* may be present from April to August depending on temperature and breeding site abundance. The majority of adult *Culex* females that develop in mid to late August do not blood feed before mating and seeking overwintering sites (winter diapause). *Culex* females that develop from mid-summer broods may take numerous blood meals from WNV infected birds and when biting mammals infect the mammals with the virus.

WNV appears to be lethal to many birds in the family Corvidae (e.g., American crows, ravens and jays) and the presence of WNV-positive dead birds is the often the first sign that WNV is present and spreading through the local bird population (this is known as epizootic amplification). It is likely that *Cx. restuans* is the key species involved in the early season amplification of WNV in the bird population (it is possible that urban sparrow and starling populations may have a role as reservoirs for WNV). The virus eventually spills over into the human population later in the season when *Cx. pipiens* is predominate and is breeding in catch basins. *Cx. pipiens* is thought to be the main “bridge vector” since it predominately bites birds but will also bite mammals. Other mosquito species such as *Aedes vexans*, *Culex salinarius* and certain *Ochlerotatus* species may also have a role as bridge vectors. Controlling *Culex* mosquitoes in the early spring in surface waters to reduce the amplification of WNV in the bird/mosquito cycle and throughout the summer in catch basins to prevent the spill over of WNV to human populations should be considered as part of an integrated mosquito control program.

**The use of larvicides should be considered as part of an integrated mosquito management program that includes:**

- **public education and awareness campaigns that promote personal protection**
- **mosquito breeding site reduction on private and public property**
- **removal and proper disposal of discarded tires and other containers that hold stagnant water, and**
- **monitoring and surveillance programs**

**Larviciding programs, based upon monitoring larvae presence, should be considered through early spring to mid summer in stagnant surface water bodies such as ditches and in mid to late summer in catch basins to greatly reduce mosquito larvae development.**

Larviciding should be targeted to those catch basins that have high organic content due to a close proximity of trees or lawns which may contribute leaves and grass clippings. In general, catch basins located along major roadways and in parking lots do not have high organic content and therefore mosquito larvae are likely to be in low numbers.

Other species of mosquitoes that are predominant in summer months, such as *Aedes vexans*, *Coquillettidia perturbans* and other species that are less common such as *Culex salinarius*, *Ochlerotatus trivittatus*, *Och. triseriatus*, *Och. stimulans*, *Anopheles punctipennis* and *An. walkeri* may act as “bridge vectors” transmitting WNV from infected birds to humans. *Aedes vexans* breeds predominately in temporary pools created by rainfall (e.g., roadside ditches, flooded pastures). Adult mosquitoes are present from May to first hard frost. *C. perturbans* has one generation per year and breeds in cattail marshes.

If adult mosquito trap surveillance indicates that bridge vectors other than *Cx. pipiens* or *restuans* have a high rate of virus infection then it may be necessary to initiate larviciding programs to target these specific species. Larviciding through late spring to early fall of temporary pools created by rainfall will control *Aedes vexans* larvae from developing into adult mosquitoes. This should reduce the number of adult mosquitoes and lower the risk of humans developing WNV from summer biting mosquitoes. The control of *C. perturbans* in cattail marshes is very difficult. The larvae do not surface feed but attach to hollow cattails to breathe and filter feed below the surface therefore the larvicide often does not contact the larvae.

### **3.0 Pesticide Regulations**

The management of pesticides is a joint responsibility of the federal and provincial governments. Health Canada’s Pest Management Regulatory Agency (PMRA) is responsible for assessing pesticides to determine if they are acceptable in terms of safety, merit and value. Pesticides approved by PMRA are granted registration which allows them to be sold and used in Canada.

The Ministry of the Environment (MOE) regulates the sale, use, transportation, storage and disposal of federally registered pesticides in Ontario under the *Pesticides Act* and Regulation 914. Pest control products are classified into one of six classes or “schedules”. The schedule determines who can sell or use the pesticide product and what restrictions (e.g., requires a licence and/or permit) are placed on its use. For current information on classified products, consult the Ontario Pesticides Advisory

Committee web site and link to the PEPSIS data base at [www.opac.gov.on.ca](http://www.opac.gov.on.ca).

**Appendix 3** provides a list of currently classified larvicides for use under permit for WNV.

#### **4.0 Municipal or Health Unit WNV Prevention and/or Control Programs**

A municipality or Health Unit has the authority to conduct a larviciding program only on public land or on land where an easement exists for the purpose of drainage management. These larvicide control programs would likely be initiated under a local MOH directive or request for preventative mosquito control in an urban area. In order to expand the larviciding program onto private land, the municipality or Health Unit must obtain written permission of the private land owner or a health hazard order must be issued, covering private land, by the local MOH under Section 13 of the *Health Protection and Promotion Act (HPPA)*. A permit application that is supported by a health hazard order, issued by the local MOH, will be considered as a very high priority by MOE.

A permit application form may be submitted by:

- a licensed exterminator contracted by a municipality or Health Unit
- an official representative of a municipality or Health Unit who have on staff full-time employees who hold appropriate exterminator's licenses

The written support of, or *HPPA* health hazard order from, the local MOH must accompany the permit application form. **Appendix 4** provides sample local MOH support letter templates.

**MOE encourages early submission (e.g., early April) of completed permit application forms and supporting documentation by either a municipality, Health Unit or licensed exterminator on behalf of the municipality or Health Unit. Submissions will be reviewed and considered for approval subject to site-specific terms and conditions appended to the permit.**

#### **4.1 Surveillance**

Dead bird surveillance, adult mosquito trapping, larvae surveys and mapping are very important for determining the need for larviciding programs. Municipalities and Health Units are encouraged to conduct surveillance and monitoring programs. If not already carried out in the previous year, municipalities and Health Units should begin in early spring to conduct dead bird surveillance, human surveillance and larvae monitoring to determine if a larviciding program is warranted. Adult mosquito surveillance should also be conducted starting in mid June.

## **4.2 Licensing Requirements and Technicians**

A pest management company requires an Operator's licence in order to run a business that uses pesticides to control pests. A pest management company that provides a service to control mosquito larvae is conducting a water extermination. This requires at least \$1 million in third-party liability insurance and other insurance requirements prescribed in Regulation 914. In addition, the company must ensure that its insurance policy allows for the use of pesticides in water (i.e., the policy has no exclusion for water exterminations). An Operator must hire appropriately licenced exterminators to carry out the larviciding program. A municipality or Health Unit that intends to use a larvicide on public property that is under the control of that municipality or Health Unit is not required to obtain an Operator's licence if their full-time employees are appropriately licensed and apply the larvicide.

A WNV larviciding program must be conducted by an appropriately licensed exterminator holding one of the following valid licences:

- Mosquito/Biting Flies for ground equipment application of a larvicide
- Aerial for aircraft application of a larvicide

**An appropriately licensed exterminator may indirectly supervise (i.e., visit the extermination site at least once per week) up to 7 technicians. See Section 20.1, 20.2 and 20.3 of Regulation 914 under the *Pesticides Act* (on line versions are available at [www.e-laws.gov.on.ca](http://www.e-laws.gov.on.ca)) regarding the restrictions on the use of pesticides by unlicensed assistants.**

## **4.3 Permit Submission**

Municipalities or Health Units may decide to submit a permit application in order to conduct larviciding programs based upon scientific/health related data such as real time dead bird and mosquito surveillance activities or past years surveillance data.

**MOE will only consider the use of larvicides containing methoprene or *Bacillus thuringiensis* var. *israelensis* under permit use for the control of WNV.**

Permit application forms and support documents for larviciding should be submitted separately for any of the following four types of larviciding programs:

### **A. Catch basins/storm drains:**

- Methoprene products will be considered for application to catch basins/storm drains since these are high in organic content and suspended silt and it is unlikely that non-target aquatic organisms will be present (Note: *Bti* has limited efficacy in water bodies with high organic and silt content).

- Label rate for methoprene pellets is 0.7 g per catch basin (equivalent to a broadcast application rate of 11.2 kg/ha in water with a high organic matter content) based on an average surface water area of 0.6 m<sup>2</sup>. Catch basins with an average surface water area greater than 0.6 m<sup>2</sup> would receive proportionately more of the methoprene pellets.
- A greater amount of methoprene pellets per catch basin is consistent with label directions if drainage from the catch basin is impeded and the water in the catch basin is backed up, above the level of the outlet pipe, allowing standing water in the storm sewer drain. This would be determined by a pre-treatment inspection (see **Appendix 8**). A review of best practices indicates that an amount of up to 3.5 g of methoprene pellets may be applied in such situations and is consistent with label directions.
- See **Appendix 8** for detailed information on determining application rates.

**B. Ditches and Temporary Pools or Permanent Pools including storm water management ponds**

- *Bacillus thuringiensis* var. *israelensis* (*Bti*) products will be considered for application in ditches and temporary pools or permanent pools including storm water management ponds since these water bodies may support non-target aquatic organisms (methoprene may have an impact on these organisms whereas *Bti* is very specific to mosquito larvae and only has a minimal impact on other aquatic fly larvae).
- The rate of application will be determined by the larval instar stage, target species, organic content of water etc. as indicated on product labels.

**C. Sewage and sludge storage lagoons**

- Methoprene products will be considered for application in sewage and sludge lagoons since these water bodies are high in organic content and it is unlikely that non-target aquatic organisms will be present (Note: *Bti* has limited efficacy in water bodies with high organic content).
- A label rate for methoprene products of 11.2 kg/ha for broadcast application of pellets and 22.4 kg/ha of granules is in accordance with label directions for water with a high organic content (See **Appendices 5 and 6** for determining organic content of water bodies).

**D. Wetlands:** Permit applications will be reviewed according to the Wetlands Protocol developed in cooperation with the Ministry of Natural Resources and the appropriate environmental agencies (see **Appendix 10**).

- *Bacillus thuringiensis* var. *israelensis* (*Bti*) products will be considered for use in wetlands since these water bodies support non-target aquatic organisms (methoprene may have an impact on these organisms whereas *Bti* is very specific to mosquito larvae and only has a minimal impact on other aquatic dipterans).

- The rate of application will be determined by the larval instar stage, target species, etc., as indicated on *Bti* product labels.

#### **4.4 Permit Submission Checklist**

##### **Previous Applicants:**

Applicants who:

- obtained an approved permit in 2003 for a mosquito larvae control program for WNV and provided MOE with hard copy maps/electronic maps and/or digital mapping coordinates; and
- are applying for a permit to conduct a 2004 mosquito control program for WNV without changes to the proposed treatment area information

must provide items 1, 2, 3, 4, 6 and 7 below. You are not required to resubmit maps (item 5 below) with your permit application submission, however, maps will be required with your summary report.

##### **New Applicants:**

A new application for a permit to use a larvicide for the control of mosquito larvae as a preventative or control action against WNV **must** include the following information as support documentation:

1. ☐ A completed permit application form (see **Appendix 1**). Use permit application Form 7A when applying for approval to use a larvicide in catch basins and Form 7B when applying for approval to use a larvicide in surface water bodies. If it is not possible to provide the name, licence number and business information (including the name and Operator's licence number if applicable) of the licensed exterminator responsible for carrying out the larviciding program (i.e., water extermination) at the time of applying for the permit, then this information may be submitted immediately prior to the initiation of larviciding.
2. ☐ A written statement, signed by an official representative of the jurisdiction that owns the catch basins and storm drains, authorizing the use of a larvicide by the municipality or Health Unit. This written statement must indicate authorization to apply a larvicide into these water bodies owned by another jurisdiction within that Health Unit or municipality. (See **Appendix 4**) **NOTE:** This written statement is not required if an order is issued under the *Health Protection and Promotion Act*.
3. ☐ A copy of an order under the *Health Protection and Promotion Act* **or** a letter of support from the Local MOH indicating:
  - A mosquito larviciding program is considered necessary or appropriate to reduce *Culex restuans* or *Cx. pipiens* larvae and prevent the epizootic amplification of WNV, based upon current data or data obtained from the previous year's WNV-positive dead bird and/or mosquito surveillance programs in that jurisdiction or a neighbouring jurisdiction **and/or**

- A mosquito larviciding program is considered necessary to reduce *Cx pipiens*, *Aedes vexans* or other mosquito species that may act as a bridge vector species for WNV from birds to humans based on data obtained from the current year's WNV-positive dead bird/animal/human and/or mosquito surveillance programs.
- 4. ☐ A written statement from the municipality or Health Unit indicating it intends to treat water bodies located on private property. Letters of permission from private property owners authorizing the municipality or Health Unit to use a larvicide on their property (for example: if a catch basin or ditch is on private land and no municipal easement allowance is in place) must be obtained by the municipality or Health Unit. **These letters do not need to be submitted with the permit application but must be retained on file by the municipality or Health Unit.** **Note: these permission letters are only required if a municipality or Health Unit proposes to place larvicides into water bodies that are located on private property.**
- 5. ☐ Map(s) of the treatment site. Submission of electronic maps and/or digital mapping data are strongly encouraged. If available, please provide digital mapping data to the Regional Pesticides Specialist who will use your electronic information to generate maps for MOE purposes (depending on location within Ontario). Digital mapping coordinates and street addresses should be submitted as detailed in **Appendix 9**.

**(NOTE:** if a municipality or Health Unit does not have sufficient mapping information to show exact map locations of all catch basins, ditches or pools that are proposed for treatment with a larvicide then MOE will accept a statement that “x” number of catch basins, ditches, pools, etc., are planned to be treated within a marked boundary location on the maps submitted - the MOE encourages that the location of all treated catch basins be identified with digital mapping coordinates and be provided with the summary report.

The minimum requirements for map elements for any type of larviciding program are as follows:

- map scale 1:25,000
- identification of all Sensitive areas (see **Appendix 7** for detailed definitions) including;
  - critical fish habitat – feeding, migration, nursery and spawning areas
  - wetlands - marshes, bogs, fens and swamps
  - headwater areas – the area starting at the lake highest up in the watershed
  - fish sanctuary – area where fishing for all species is prohibited
  - fish hatchery – designated area of fish rearing
  - endangered species habitat – as designated in Regulations under the Endangered Species Act

- ▶ irrigation water sources – water drawn for the irrigation of crops/turf
- ▶ potable and livestock water supplies – water used for human and animal consumption
- ▶ areas where human recreational water activities may occur – examples: swimming, wading etc.

Mapping information for catch basins must include

- the approximate boundaries of the treatment area(s) / storm sewer shed
- the approximate number and approximate area of catch basins proposed for the treatment area / storm sewer shed
- the location of all discharge points/outflows if catch basins are located at or near a Sensitive area
- the name of the immediate receiving water (e.g., Lake Ontario, Humber River) if catch basins are not located at or near a Sensitive area

Mapping information for ditches, temporary and permanent pools, storm water retention ponds and wetlands\* must include:

- the approximate boundaries of the treatment area(s)
- the location of all discharge points/outflows if the surface water treated is located at or near a Sensitive area
- the name of the immediate receiving water (e.g., Lake Ontario, Humber River) if the surface water treated is not located at or near a Sensitive area
- the estimated total area (in hectares) proposed for treatment

\* Permit Applications for wetland areas must follow the protocol for a Wetlands permit (see **Appendix 10**).

6. ☐ A description of measures that will be used to protect Sensitive areas from potential impact due to possible movement of the larvicide from the target area.
7. ☐ Monitoring data - monitoring is required for some types of larviciding programs. See Section **5.0** below for **required** pre and post larviciding monitoring data and Section **6.0** for **recommended** monitoring procedures.

#### **4.5 Summary Report Requirements**

MOE approved permit conditions will require that a summary report be submitted by December 1<sup>st</sup> identifying the location(s) where larviciding treatments occurred. The MOE strongly encourages that all information submitted on the actual locations and/or areas of larvicide use be submitted in electronic format including digital mapping coordinates (see **Appendix 9**). The summary report must include the following information:

- ▶ a map indicating the locations of all applications of a larvicide to catch basins, ditches and temporary or permanent pools including storm water management

ponds or wetlands and the name of the immediate receiving waters into which they discharge (e.g., Humber River, Cranberry Marsh).

- ▶ the total number of treated catch basins, ditches and temporary or permanent pools including storm water management ponds or wetlands and dates of all treatments.
- ▶ the digital mapping coordinates of the water bodies located on private property (if private property treatments took place and permission letters are on file).
- ▶ the name of the pesticide used, *Pest Control Products Act* number, rate of application and quantities of product used in **each** water body.
- ▶ copies of the actual newspaper notice(s) (including the date of publication and newspaper name) or written notice(s) (including method of distribution such as bulletin board, door to door etc.).
- ▶ reference to any incidents involving the handling or use of the larvicide that was reported to the District MOE office or SAC.
- ▶ Completed pre and post larviciding efficacy monitoring forms (see **Appendices 5 and 6**) for each water body if required (see Section **5.0** below for MOE requirements).

## **5.0 MOE Permit Requirements for Monitoring**

A textual description of the methods that will be used to comply with the MOE requirements listed below **must be included** with the permit application support documentation.

### **A. Catch basins/storm drains using methoprene:**

- No monitoring requirements (see Section **6.0** below for monitoring recommendations).

### **B. Ditches and Temporary or Permanent pools (including storm water management ponds) using *Bti*:**

- MOE **requires** that pre-larviciding monitoring be conducted to determine organic matter content (e.g., presence of algae on water surface indicates high organic content and requires higher label rate) and larval instar stage (e.g., lower label rate for 1<sup>st</sup> and 2<sup>nd</sup> instars; higher label rate for 3<sup>rd</sup> and 4<sup>th</sup> instars) in order to select the proper application rate of *Bti* (see **Appendix 5**). **Note:** larvae must be present in order to apply *Bti*.

### **C. Sewage or Sludge lagoons using methoprene:**

- No efficacy monitoring requirements (see Section **6.0** below for efficacy monitoring recommendations).

### **D. Wetlands using *Bti*:**

- MOE **requires** that pre-larviciding monitoring be conducted to determine degree of organic material content and larval instar stage in order to select the proper

application rate of *Bti*.

- MOE **requires** that post-larviciding monitoring of 10 typical sites (minimum) be conducted to sample the number of larvae present within 24 - 48 hours after treatment of *Bti* to determine efficacy (see **Appendix 5**).

## **6.0 MOE Recommendations for Monitoring**

MOE recommendations listed below are at the discretion of the permit holder.

### **A. Catch basins/storm drains using methoprene:**

- MOE **recommends** pre-larviciding monitoring of catch basins to determine larvae counts and evaluate a need to apply methoprene.
- MOE **recommends** post-larviciding monitoring of catch basins to determine pupal development to adult (refer to the methoprene product guide literature or the guidance for methoprene efficacy monitoring provided in **Appendix 6**).

MOE suggests that a minimum of 30 catch basins proposed for larvicide treatment be randomly selected and monitored for methoprene efficacy.

### **B. Ditches and Temporary or Permanent pools (including storm water management ponds) using *Bti*:**

- MOE **recommends** post-larviciding monitoring of ditches and temporary or permanent pool to sample the number of larvae present within 24 - 48 hours after treatment with *Bti*.

MOE suggests that post-larviciding monitoring include as a minimum, several ditches, temporary pools and permanent pools and sampling around the margins at several points of these water bodies.

### **C. Sewage or Sludge lagoons using methoprene:**

- MOE **recommends** pre-larviciding monitoring at 10 points around the perimeter of sewage or sludge lagoons to determine larva counts and evaluate a need to apply methoprene.
- MOE **recommends** that post-larviciding monitoring at 10 points around the perimeter of sewage or sludge lagoons to determine pupal development to adult (refer to the methoprene product guide literature or the guidance for methoprene efficacy monitoring provided in **Appendix 6**).

### **D. Wetlands using *Bti*:**

See requirements in section **5.0** above.

## **7.0 Permit Conditions**

Permit applications will be reviewed by the Regional Pesticide Specialists. A permit application that is complete and includes all of the required support documentation will be processed within five business days of receipt.

**A licensed exterminator who is granted an approved permit to apply a larvicide must comply with the requirements of Regulation 914 under the *Pesticides Act*. In addition, the approved permit may have the following conditions:**

- Larvicide use is limited to a licenced exterminator (Mosquito/Biting Flies for ground-based application or Aerial for aircraft application), or a trained Technician under the supervision of a Mosquito/Biting Flies licence holder (in accordance with Sections 20.1 and 20.2 of Regulation 914 under the *Pesticides Act*) or a licensed exterminator who is considered a Technician in accordance with Section 20.1 (1.1) of Regulation 914 under the *Pesticides Act*.
- This permit and conditions of use are approved for 2004 only.
- A copy of the permit must be provided to each larviciding crew at an extermination site.
- Larvicide must be applied according to label directions.
- Larvicide must be placed into catch basins through the grate and must not be applied to catch basins if there is sufficient water flow, such as during heavy rainfall, that does not allow for the proper settling of the larvicide at the bottom of each catch basin sump.
- Public notification must be provided as set out in the document “Public Notification of a Water Extermination for the Control of Immature Stages of Mosquitoes (Larviciding Programs for WNV)” (see **Appendix 2**).
- The licensed exterminator responsible for the use of the larvicide must immediately report any situations involving health or environmental effects or damage to property resulting from the application of the pesticide to the local MOE District Office (telephone number will be provided on the approved permit), or if a pesticide spill occurs, to the Spills Action Centre at 1-800-268-6060.
- A summary report must be provided by December 1<sup>st</sup> of the year to the Regional Pesticides Specialist.
- Additional conditions determined on a case by case basis.

## **Appendix 2**

### **Public Notification of a Water Extermination for the Control of Immature Stages of Mosquitoes (Larviciding Programs for West Nile Virus) Municipal/Health Unit Programs**

**Public notification Option 1 or 2 or 3 must be used when a larvicide is applied to:**

- A. Catch Basins**
- B. Ditches, temporary or permanent pools including storm water management ponds**
- C. Sewage or sludge lagoons**
- D. Wetlands**

#### **Option 1**

**Publication of a notice in a newspaper of general circulation in the vicinity of the proposed water extermination at the beginning of the larviciding program and printed such that it is not less than 10 cm in width or the nearest equivalent in column layout. (For example, a notice would be published in a local newspaper in April indicating that larvicide will be placed in catch basins within a specific area of a municipality/Health Unit every three weeks until September). See sample notice below.**

#### **Option 2**

**Distribution of a written notice at the beginning of the larviciding program to all land owners or persons in charge of land within the application area. In addition, the posting of the notice at all door entrances to public buildings on the land prior to each larviciding treatment and to remain posted for at least 48 hours. See sample notice below that can also be modified for surface water larviciding.**

**The notice in Option 1 and 2 above must include the following:**

- **The details of the larviciding program including:**
  - ▶ **the pest to be controlled (i.e., mosquito larvae) and purpose for control (i.e., West Nile Virus).**
  - ▶ **proposed date(s) the water extermination is to take place.**
  - ▶ **the location of the larviciding program (e.g., name of the water body, street boundaries, all catch basins on a specific street, etc.).**
  - ▶ **the name of the larvicide and the registration number assigned to the product under the Pest Control Products Act (Canada).**
  - ▶ **the formulation (e.g., pellet, granular).**
  - ▶ **a telephone number (indicating collect calls will be accepted) that provides the public with information regarding the larviciding program and includes updates on the street location and dates of larviciding. A web site may be used in addition to a telephone number.**

## **Sample Notice for Catch basins:**

### **NOTICE OF PESTICIDE USE**

**Between April 1 to October 31, 2004 the Town of Pleasantville will be conducting a larviciding program under the authority of the Local Medical Officer of Health to control larval mosquitoes in order to prevent their development into vectors of West Nile Virus. The pellet formulation of the larvicide methoprene [provide Product Name and registration number under the Pest Control Products Act (Canada)] will be placed into catch basins of storm drains in the following area [provide street boundaries]. All larvicide will be applied by Ministry of the Environment licensed applicators or trained technicians. For details on the exact locations and dates of treatment please call [1-800----- if not a toll-free number indicate collect calls will be accepted] or at the following web site: www.-----.**

#### **Option 3**

**The conspicuous posting of a public area sign (rectangular and at least 51 cm high and 38 cm wide) every 100 metres along the perimeter of the surface water body OR at all entrances to the property immediately before the application of the larvicide and remaining for at least 48 hours. The public area sign must include the following on the front of the sign:**

- ▶ **red lettering with the words “WARNING” and “PESTICIDE USE”**
- ▶ **a red circle and red bar over a single black silhouette of an adult person**
- ▶ **black lettering with the words “FOR INFORMATION CONTACT” and “CALL COLLECT” and a telephone number provided in 1.5 cm high numerals (indicating collect calls will be accepted) that provides the public with information regarding the larviciding program and includes updates on the street location and dates of larviciding**
- ▶ **black lettering with the words “DATE POSTED” and “DATE SPRAYED” or “DATE APPLIED” (these dates will be the same since the sign must be posted immediately before larviciding - lettering and numerals must be 1.5 cm high)**

**The public area sign must include the following on the back of the sign:**

- ▶ **black lettering with the words “PESTICIDE” and 1.5 cm high lettering to indicate the name of the pesticide used (e.g., Methoprene or Bacillus thuringiensis israelensis or the product name)**
- ▶ **black lettering with the words “REGISTRATION NUMBER” and 1.5 cm high numerals to indicate the Pest Control Products Act Number of the product**
- ▶ **black lettering with the words “TO CONTROL” and 1.5 cm high lettering to indicate the pest (e.g., Mosquito Larvae)**
- ▶ **A web site may be provided in the bottom 5 cm of the sign**

26863	Aquabac 200G Bt Serotype H-14 (200 ITU/mg)	Y	AFA Environmental Inc. 1100 Rene Levesque Blvd. West, 25th Floor Montreal, QC H3B 5C9	2
27694	Altosid XR Briquets Methoprene 2.1%	N	Wellmark Int. P.O Box 20040, Woodlawn Postal Outlet Guelph, ON N1H 8H6	2

Consult with the PMRA at 1-800-267-6315 to ensure current registration status.

\* A pesticide may only be applied by aircraft if the label directions specify this method of application.

Aquabac 200G Biological Larvicide 10/14 is also registered and classified as a DOMESTIC product (PCP No. 27374) and classified in Ontario (Schedule 3). Consult label directions for specific user and application site restrictions.

Appendix 4  
Templates -

1. Local Medical Officer of Health Order
2. Support Letter for Private Lands
3. Jurisdictional Authorization

Note: the following templates may contain statements that do not apply to all jurisdictions.

Template 1.

Order

Made Pursuant to Section 13 of the *Health Protection and Promotion Act*, R.S.O. 1990, c. H.7

Date:

To:

WHEREAS pursuant to the *Health Protection and Promotion Act*, R.S.O. 1990, c. H.7, as amended (the "Act"):

1. a "health hazard" includes any thing or "animal other than man" that has or that is likely to have an adverse effect on the health of any person;
2. the Medical Officer of Health may, by order, require any person to take, or refrain from taking any specified action with respect to a health hazard. Such an order may include a requirement to do specified work, on or about premises specified in the order, and may include a requirement to destroy things specified in the order,
3. the Medical Officer of Health, or a person acting under his/her direction, is authorized to enter and have access to, through and over any premises in order to carry out a direction given under the Act. The authority to enter premises, however, is not authority to enter a private residence without the consent of the occupier;
4. no person shall hinder or obstruct a person acting under the direction of a Medical Officer of Health lawfully carry out a power, duty or direction under this Act;
5. any person who fails to obey an order made under this Act is guilty of an offence and is liable on conviction to a fine as outlined below; and
6. every board of health is required to ensure the provision of health programs and services including the prevention or elimination of health hazards and the control of infectious and reportable diseases.

AND WHEREAS pursuant to section 474.21 of the *Municipal Act*, 2001, S.O. 2001, c. 25, the [name of regional municipality] has all the powers, rights and duties of a board of health under the *Health Protection and Promotion Act* 2002, c. 17, Sched. A, s. 91.; [NOTE: this statement applies only to regional municipalities and does not include The District Municipality of Muskoka].

I, [name of Medical Officer of Health of the name of jurisdiction] order you to assist in, and facilitate the implementation of, such treatment methods as directed by me, in the [name of jurisdiction under the order], to control and reduce the number of mosquito larvae including, but not limited to assisting in and facilitating the:

1. application of larvicides to known or suspected mosquito breeding sites including but not limited to areas of standing water in catch basins, storm water management ponds, ditches, ponds and other bodies of water; and
2. employment of measures to eliminate standing water on public and private property;

THE REASONS FOR THIS ORDER ARE THAT:

1. in 200\_ , the Medical Officer of Health received laboratory confirmation that certain persons in [name of MOH's jurisdiction] became infected with the West Nile Virus;
2. in 200\_ , the Medical Officer of Health received laboratory confirmation that certain mosquitoes in the [name of MOH's jurisdiction] were infected with the West Nile Virus;
3. West Nile Virus is transmitted to humans by mosquitoes. Mosquitoes are known to breed in areas of standing water within [name of MOH's jurisdiction] including catch basins, storm water management ponds, ditches, ponds and other bodies of water;
4. West Nile Virus can adversely affect human health and, in some cases, can cause death;
5. it is reasonable to expect that mosquitoes infected with West Nile Virus are now breeding and the risk of human infection will increase as the weather becomes warmer;
6. to protect human health, I believe it necessary to institute a mosquito control program which includes the application of larvicides to areas of standing water which may contain mosquito larvae and populations;
7. to be effective, larviciding must take place in the spring and summer in an attempt to reduce the number of infected mosquitoes and the consequent threat to human health; and
8. I am advised by [name of MOH's jurisdiction] Public Health representatives that the [name of MOH's jurisdiction] has retained a licensed applicator of larvicides to apply mosquito control treatment methods on public and private property which application program can start forthwith.

Therefore, I am of the opinion on reasonable and probable grounds that:

1. a health hazard exists in the health unit served by me; and
2. the requirements specified in this order are necessary to decrease or eliminate the health hazard.

## NOTICE

TAKE NOTICE THAT you are entitled to a hearing by the Health Services Appeal and Review Board if you deliver to me and to the Health Services Appeal and Review Board, Health Boards Secretariat, 151 Bloor Street West, 9<sup>th</sup> Floor, Toronto, Ontario. M5S 2T5, notice in writing, requesting a hearing within fifteen (15) days after service of this Order.

AND FURTHER TAKE NOTICE THAT although a hearing may be requested, this Order takes effect when it is served to you.

FAILURE to comply with this Order is an offence for which you may be liable, on conviction, to a fine of not more than \$5,000.00 (for a person) or \$25,000.00 (for a corporation) for every day or part of each day on which the offence occurs or continues.

[Signature of MOH]

## Template 2.

To: Regional Pesticide Specialist  
[see Table 1 page 14 for address]

Dear:

RE: West Nile Virus - Application of Larvicides on Private Lands

This letter is to confirm that I support the Ministry of the Environment issuing permits for the application of larvicides to mosquito breeding sites on private lands with the [name of MOH's jurisdiction], especially as it relates to standing waters and catch basins. I would also support the application of larvicides to other areas within the [name of MOH's jurisdiction], under the jurisdiction of other governmental authorities, found to contain mosquito species known to transmit West Nile virus.

My decision to support this is based on the Health Department's 200 WNV surveillance and monitoring program which identified human cases as well as extensive enzootic spread. These findings represent a significant health risk to the residents of [name of MOH's jurisdiction].

This support has the following conditions:

- Application of larvicide to water bodies on private land only if the water body cannot be drained or modified.
- The licensed exterminator must provide in writing a copy of all permits. The information submitted must identify clearly the addresses of the private properties and the type of water bodies intended to be treated with a mosquito larvicide before the larviciding program begins.
- Copies of the year end reports (summary reports) submitted to the Ministry of the Environment, when completed, for all permits issued must be also submitted to the Health department.

I am also enclosing copies of letters from municipalities in the [name of MOH's jurisdiction].

[Signature of the Medical Officer of Health]

## Template 3.

To: Local MOH

Dear MOH:

The [name of municipality within the MOH's jurisdiction] supports local action by [name of MOH's jurisdiction] to reduce the risk of West Nile virus. As a result, [name of municipality within the MOH's jurisdiction] supports any permit application for West Nile virus control submitted to the Ministry of the Environment from an appropriately licensed exterminator, contracted by a private property owner, to apply a larvicide into catch basins or ditches located on private property.

[Signed by an official representative of the municipality]

## POST-LARVICIDING MONITORING FOR METHOPRENE EFFICACY

1. Determine the catch basins that will be used in the monitoring study. Take samples of pupae from these same catch basins every week. Note the date when the larvicide was applied, the organic content, any oil sheen on water surface and temperature of the water. Do not take samples after a major rain event since pupae will likely to have been flushed out of the catch basin.
2. Collect 3 separate samples of pupae\* only once a week from each of the randomly selected treated catch basins and from nearby untreated catch basins (if available). Record number of pupae.
3. Place the pupae in a covered foam coffee cup or soup container (half-filled with water from the catch basin) and cover with netting or screening. Transport in a cooler with ice packs. Place the container in a sheltered area where the pupae will not be disturbed. Keep at a constant temperature, without direct light (i.e., they can be kept in a room in which the light is on during the day and turned off at night).
4. Check for emergence every day for up to four days and identify the emerged species.
5. Count the number of dead pupae (DP), dead adults (DA) and alive adults (AA).
6. Use the following formula to determine the % control =  $(DP+DA) \div (DP+DA+AA) \times 100$
7. Record results in an Excel spreadsheet format to facilitate calculations (see example below)

Most catch basins should have less than 10% emergence up to 21 days using methoprene pellets. Some catch basins may show less control (perhaps due to flushing, larger than normal size catch basin or storm drain, or some other reason) and should be retreated.

\* Pupae may be difficult to capture, if so, capture late 4<sup>th</sup> instar larvae and allow to pupate. These should remain separate from any captured pupae. Do not capture earlier instars as these will not provide a measure of efficacy.

### Recording Results:

Treated Site	No. of Pupae	DP	DA	AA	% Control	Control Site	No. of Pupae	DP	DA	AA	% Control
Sample 1						Sample 1					
Sample 2						Sample 2					
Sample 3						Sample 3					
Sample 4						Sample 4					
Sample 5						Sample 5					
Sample 6						Sample 6					
Sample 7						Sample 7					
Sample 8						Sample 8					
Sample 9						Sample 9					
Sample 10						Sample 10					

## Appendix 7 Sensitive Areas - Definitions

**SENSITIVE AREA** is defined by the Ministry of Natural Resources (MNR) as a critical fish habitat, e.g., spawning areas, wetlands, headwaters, migration areas, nursery areas, intermittent streams that provide spawning habitat for fish; fish sanctuaries; fish hatcheries; stocked lakes and rivers; endangered species, protected species or species at risk habitat; patented land.

### **SENSITIVE AREAS REQUIRING PROTECTION - DEFINITIONS**

**CRITICAL FISH HABITAT:** Is habitat judged to be of critical importance to the maintenance of a healthy fish population (includes: feeding areas, migration areas; nursery areas; spawning areas).

**WETLANDS:** Are lands that are seasonally or permanently covered by shallow water as well as lands where the water table is close to, or at the surface; in either case, the presence of abundant water has caused the formation of hydric soils and has favoured the dominance of either hydrophytic or water tolerant plants. The general term wetlands, includes specific land types that are known as marshes, bogs, swamps and fens.

- Swamps are wooded wetlands with 25% cover or more of trees or tall shrubs. In swamps, standing to gently flowing waters occur seasonally or persist for long periods on the surface. Swamps include both forest and thicket swamps.
- Marshes are areas periodically inundated with standing or slowly moving water, and/or permanently inundated characterized by robust emergents, and to a lesser extent, anchored floating plants and submergents.
- Bogs are peat-covered areas or peat-filled depressions with a high water table and a surface carpet of mosses, chiefly *Sphagnum* spp.
- Fens are peatlands characterized by surface layers of poorly to moderately decomposed peat, often with well decomposed peat near the base. They are covered by a dominant component of sedges, although grasses and reeds may be associated in local pools.

**HEADWATER AREA:** Is the area starting at the lake highest up in the watershed which requires protection under the guidelines (either greater than 10 ha or with a known fisheries value) and continues up each inflow to this lake until the top of the stream occurs, or there is a wetland, lake or beaver pond with significant retention capacity.

**FISH SANCTUARY:** Is a water body (or a portion of a water body) in which fishing for all species is prohibited for a specified period of time and is identified in the annual Ontario Sport Fishing Regulations, which is published by the MNR at <http://www.mnr.gov.on.ca/MNR/fishing/gen.html>.

**FISH HATCHERY:** Is a designated area of fish rearing.

**ENDANGERED SPECIES HABITAT:** Is the sum total of environmental conditions of a specific place occupied or potentially occupied by an endangered species (as designated in Regulations of the *Ontario Endangered Species Act*) or a population of such species.

### **Additional Areas Requiring Protection**

**HUMAN RECREATION:** Areas of human water recreation used for swimming, wading etc.

## Appendix 8

### Assessing Catch Basins to Determine Application Rate of Methoprene Pellets

Most modern catch basins are cylindrical, have 900 mm diameter (0.9 m diameter or 0.45 m radius), are 2.3-2.4 m deep in total (including ring spacers and cover), have a water depth below the outlet pipe of 600 mm (when there is no flow), and a water surface area of 0.636 m<sup>2</sup>. However, older catch basins may be of different sizes, shapes, and have different surface areas. Thus, it is important that mosquito control workers consult local public works officials on the dimensions of the catch basins in any particular area of the jurisdiction. Catch basins in newer suburban areas may differ in size from those in older downtown areas and along highways within a municipality or Health Unit.

Public Work officials may be able to provide computer-based maps and a numbering system for the catch basins within their jurisdiction. Some databases may also include information on the size of individual catch basins.

Drainage from some catch basins may be partially blocked, increasing the total water volume associated with that catch basin and others 'upstream' from it. Local water engineers may be able to advise on what percentage of the catch basins fall into this category and where they are most likely to be located.

Calculations showing how much methoprene pellets to apply to a standard modern catch basin have been provided (see below). It may be necessary to inspect a representative sample of catch basins (e.g., 1%) and base the application rate on the average surface area of the catch basins in an area.

#### Sample Calculations

Assumption: the catch basin has a 0.45 m radius.

Formula Used: Area (circle) =  $\pi r^2$  (pi x radius squared) where  $\pi = 3.14159$

Area of Standard Catch Basin:  $3.14159 \times 0.45 \text{ m} \times 0.45 \text{ m} = 0.636 \text{ m}^2$

Application Rates based on methoprene pellets: Label rate states - 5.6 -11.2 kg/ha or 0.56 -1.12 g/m<sup>2</sup> of water surface, then

Low application rate =  $0.636 \text{ m}^2 \times 0.56 \text{ g/m}^2 = 0.356 \text{ g}$

High application rate =  $0.636 \text{ m}^2 \times 1.12 \text{ g/m}^2 = 0.712 \text{ g}$

The water in a catch basin can be considered to be polluted and/or highly organic therefore the high application rate is recommended on the label.

Amount to Use per Catch Basin:

How much methoprene pellets is 0.712 g?

From the Material Safety Data Sheet (MSDS), we find Specific Gravity = 1.04 g/cc

Thus,  $1.04 \text{ g/1 cc} = 0.712 \text{ g/'x' cc}$ ; therefore, 'x' = 0.69 cc

Because 1 teaspoon = 5 cc then 0.69 cc = ~ 0.14 teaspoons use slightly under a quarter teaspoon/ standard catch basin

Measuring Spoons:

Long-handled measuring spoons are available as part of a set from most food and department stores. Due to the irregular shape of the pellets, a level 0.25 teaspoon of methoprene pellets would be a practical treatment per one standard catch basin.

## Appendix 9

### Submitting Geo-spatial Information for Municipal Mosquito Control Programs

The use of Geographic Information System (GIS) databases will provide a more efficient way of analysing the surveillance, monitoring and larviciding data collected to manage West Nile virus. The Ministry of the Environment is encouraging that all mapping data be submitted in electronic format including digital mapping coordinates derived from Global Positioning Systems (GPS). Digital map coordinates for all catch basins, ditches, temporary and permanent pools and storm water retention ponds areas could be submitted with either the permit application and/or final report. MOE will use the information to generate provincial maps for Ministry purposes in evaluating permit applications.

To ensure that there is consistency across the province, all geo-spatial data including both map coordinates and tabular information must be submitted in electronic format conforming to the data standards summarized below.

The standards which follow apply to all data submitted including format requirements for digital mapping coordinates and address standards:

- Electronic map files must be ESRI-compatible (i.e., Arc/Info coverages or ArcGIS shape files) referenced to North American Datum 83 (NAD83) projected using the Universal Transverse Mercator (UTM) projection system. UTM zone and accuracy estimates must be provided (see example below)
- All map coordinates should be submitted in a spreadsheet or database (Excel or MS Access)
- When data is submitted electronically in a spread sheet or database format, columns should use clearly identified titles and provide a detailed description of codes used
- Standard street addresses must include street number, proper spelling of the street name, standard abbreviations (see below), direction (N, S, E, W) and municipality addresses should not include any punctuation

#### Map Data Example:

ID	Zone	Easting	Northing	Accuracy
1	17	611630.56	4861180.03	±10m
2	17	622507.43	4865770.27	±10m

#### Address Example:

ID	Address	Municipality
1	1180 Lakeshore RD W	Toronto
2	252 Bloor ST E	Toronto
3	2075 Bayview AVE	Toronto

Some of the most common abbreviations include, but are not limited to the following:

<b>Avenue</b>	<b>AVE</b>	<b>Gardens</b>	<b>GDNS</b>	<b>Square</b>	<b>SQ</b>
<b>Bay</b>	<b>BAY</b>	<b>Gate</b>	<b>GATE</b>	<b>Sideroad</b>	<b>SR</b>
<b>Beach</b>	<b>BEACH</b>	<b>Heights</b>	<b>HTS</b>	<b>Street</b>	<b>ST</b>
<b>Boulevard</b>	<b>BLVD</b>	<b>Highway</b>	<b>HWY</b>	<b>Terrace</b>	<b>TERR</b>
<b>Centre</b>	<b>CTR</b>	<b>Lane</b>	<b>LANE</b>	<b>Trail</b>	<b>TRAIL</b>
<b>Circle</b>	<b>CIR</b>	<b>Line</b>	<b>LINE</b>	<b>View</b>	<b>VIEW</b>
<b>Concession</b>	<b>CONC</b>	<b>Meadow</b>	<b>MEADOW</b>	<b>Way</b>	<b>WAY</b>
<b>Corners</b>	<b>CRNRS</b>	<b>Park</b>	<b>PK</b>		
<b>Court</b>	<b>CRT</b>	<b>Parkway</b>	<b>PKY</b>		
<b>Crescent</b>	<b>CRES</b>	<b>Path</b>	<b>PATH</b>		
<b>Cul-de-sac</b>	<b>CDS</b>	<b>Place</b>	<b>PL</b>		
<b>Drive</b>	<b>DR</b>	<b>Point</b>	<b>PT</b>		
<b>Expressway</b>	<b>EXPY</b>	<b>Road</b>	<b>RD</b>		

**Appendix 10**  
**Wetland Protocol**

**Ontario Ministry of Natural Resources Process for Providing Input to MOE Concerning West Nile Virus  
Larvicide Treatments in Wetland Habitats**

**INTRODUCTION**

Public health units may order the use of larvicides in wetlands, to control mosquito populations and the spread of West Nile Virus (WNV). Decisions to implement WNV control measures are based on local risk assessments, which include consideration of the results of mosquito larvae surveillance and proximity of areas of standing water to inhabited areas.

The Ontario Ministry of the Environment (MOE) is responsible for regulating and licensing the use of pesticides, including the larvicides used to control mosquito populations. The bacterial larvicide *Bacillus thuringiensis israelensis* (Bti) is the only mosquito treatment permitted in wetlands. It targets the larvae of mosquitoes and other dipterans.

An inter-agency review committee has been established, in response to the potential negative impacts of such treatments on rare and sensitive species that may be present in these habitats. The committee consists of representatives from the Ontario Ministry of Natural Resources (MNR), MOE, and two federal agencies: Environment Canada (E.C.), and Fisheries and Oceans Canada (DFO).

**Legislative and Policy Framework:** (Note: all Acts are available on line at [www.e-laws.gov.on.ca](http://www.e-laws.gov.on.ca))

- ***Endangered Species Act:*** WNV larvicide treatments must take account potential impacts on species regulated under this provincial legislation.
- ***Species at Risk Act:*** The prohibitions and enforcement components of this federal legislation have been delayed for approximately one year, until June 2004. However, sections that relate to the assessment of species by the Committee on the Status of Endangered Wildlife in Canada (COSEWIC) are now in force, as are other sections that address requirements for the preparation of recovery strategies, action plans or management plans for species listed in Schedule 1 (as applicable) and requirements to conduct environmental assessments.
- **Accord for the Protection of Species at Risk in Canada:** As a signatory to this (1996) agreement, Ontario has made a commitment to participate in a national program that seeks to achieve the protection and recovery of species at risk, and the monitoring of all wild species. Under the Accord, signatories agree, among other things, to “provide protection for the habitat of threatened or endangered species” and to “emphasize preventative measures to keep species from becoming at risk.”

The committee provides a forum for discussion of potential impacts of WNV larvicide treatments on species at risk (SAR). The objective of the committee is to provide the MOE recommendations - which areas are to be treated, and how - that will minimize impacts on SAR.

- ***Fisheries Act:***

**Section 36:** The use of larvicides or other pesticides in areas considered to be waters frequented by fish, or fish habitat or in places where they are likely to enter waters frequented by fish or fish habitat can be considered as deposit of deleterious substances under Subsection 36(3) of the *Fisheries Act*. Section 36 would apply to wetlands designated to be fish habitat.

The Compliance and Enforcement Policy for the Habitat Protection and Pollution Prevention Provisions of the *Fisheries Act* states that compliance with the federal *Fisheries Act* is mandatory. Subsection 36(3) of the *Fisheries Act* specifies that unless authorized by federal regulation, no person shall deposit or permit the deposit of deleterious substances of any type in water frequented by fish, or in any place under any conditions where the deleterious substance, or any other deleterious substance that results from the deposit of the deleterious substance, may enter any such water. Proponents should note that only a federal regulation under the *Fisheries Act* or another Act of Parliament can authorize a discharge of a deleterious substance; no federal permit, provincial, territorial or municipal regulatory permit or approval allows for exemption from the *Fisheries Act*.

For pesticide applications, alternatives to use in areas of waters frequented by fish or fish habitat should be fully investigated. For situations where there is the likelihood of entry of these pesticides into areas of fish habitat, each situation should be assessed on a case by case basis to determine if there is the potential for deleterious impacts on the aquatic community. Environment Canada will assess each situation brought to its attention to determine whether or not there are reasonable grounds to believe that there is the potential for violation of section 36(3) of the *Fisheries Act*."

**Section 35:** Subsection 35(1) prohibits works or undertakings that result in the harmful alteration, disruption or destruction of fish habitat (HADD), unless authorized by the federal Minister under section 35 (2).

**NOTE:** section 35 is pertinent to any proposal that would physically impact fish habitat ( i.e., filling in wetlands or creeks, etc.), as opposed to larvicide applications, which are subject to section 36.

Implementation of section 35 is a cooperative effort involving a number of federal and provincial agencies, including the Department of Fisheries and Oceans, Environment Canada, conservation authorities, MNR and MOE. DFO is responsible for protecting habitats that contribute directly or indirectly to Canada's fisheries resources. If a HADD of Canadian fisheries waters (a creek, lake or littoral wetlands) is proposed, DFO should be consulted either directly or through the local conservation authority. DFO-conservation authority agreements assist in providing a streamlined approach to regulatory approvals.

Note that the determination of whether or not a given area would be considered as Canadian fisheries waters is not always straightforward. Back yard ponds and roadside ditches typically are not considered to be such, and therefore are of less concern.

If additional information is required, Medical Officers of Health and other provincial and local officials are encouraged to contact regional officials of DFO and EC. The Pest Management Regulatory Agency (PMRA) is the lead federal agency regulating the use of pesticides, and should also be involved in discussions.

- EC's regional offices are listed on the following website: [http://www.ec.gc.ca/commentreg\\_e.html](http://www.ec.gc.ca/commentreg_e.html)
- DFO's contacts are listed by region on the following website: <http://www.dfo-mpo.gc.ca>

## REVIEW PROCESS

- MOE advises appropriate MNR District Office, upon receipt of an application to apply *Bti* in wetlands. MOE is responsible for providing MNR with information on the wetland to be treated (name and location), and proposed *Bti* treatment schedule.

**Note:** In order to facilitate information exchange and the decision-making process for WNV larviciding, OMNR Districts are encouraged to provide public health units and MOE Regional Pesticide Officers with our maps. Provincial digital data are available via a shared folder, at: \\mnrpbapc0888\WNV\_Maps.

These maps show health unit boundaries, MNR district boundaries, Crown land, Provincial Parks, federal lands and evaluated wetlands. These are intended as a starting point for designated district or parks staff who will be dealing with health units. Districts may want to add other or better coverage as required e.g., Species at Risk, unevaluated wetlands, local coverage of wetlands.

- **MNR District staff accesses the Natural Heritage Information Centre's (NHIC) Natural Areas Database to determine if any endangered, threatened or otherwise "sensitive" species are known to be present in the wetland. Two species lists have been developed: one by MNR's Species at Risk Section; and the other by NHIC. These lists will be updated on a regular basis as the evaluation and listing/regulation of species at risk at both provincial and national/federal levels is an ongoing process. MNR District staff should contact the Species at Risk Section of Ontario Parks and NHIC to ensure that the District has the most current versions of the lists.**
- **MNR District staff forwards this information, in confidence, to the inter-agency committee and arranges a meeting or conference call to review the information. If a species of concern is found within the wetland, Ontario Parks' Species at Risk Section, and the Natural Heritage Information Centre can provide advice on potential impacts/referrals to other experts. A site visit may help facilitate the review process.**
- **MOE, with input from MNR, provides a written summary to all participants of the decisions made.**
